California Master Builders was contracted by the City of Santa Clarita to conduct design-build services for the renovation of the existing San Francisquito Creek Trail.

Renovation will improve the free travel of bicyclist and pedestrians via an undercrossing at the active Newhall Ranch Road Bridge while implementing a new retaining wall system.

The existing bike path at the San Francisquito Creek Trail shall be removed, and a new bike path, adjacent access road, and retaining wall was designed and will be constructed.

The project’s estimated cost is $1.2M dollars over a 5-month duration beginning in May and ending in September. With a total of 45 bid items, the major cost are structural demolition at $91,000, earthwork cut and fills at $300,000, and concrete placement at $86,000.

Clayey sand and silty sand are found around the site. This location is also outside the fault hazard zone and the footing will be located above the water table.
